

## Trend Reversal Probabilities:

Highest probability of trend reversal occurs when prices are at the Perspective Time Frame Zones.

If there is not a Zone, use Fibonacci Extensions and focus on the 100%, 127.2%, and 161.8% extensions for trend reversals. The 61.8%, 113%, and 138.2% are usually only corrections.

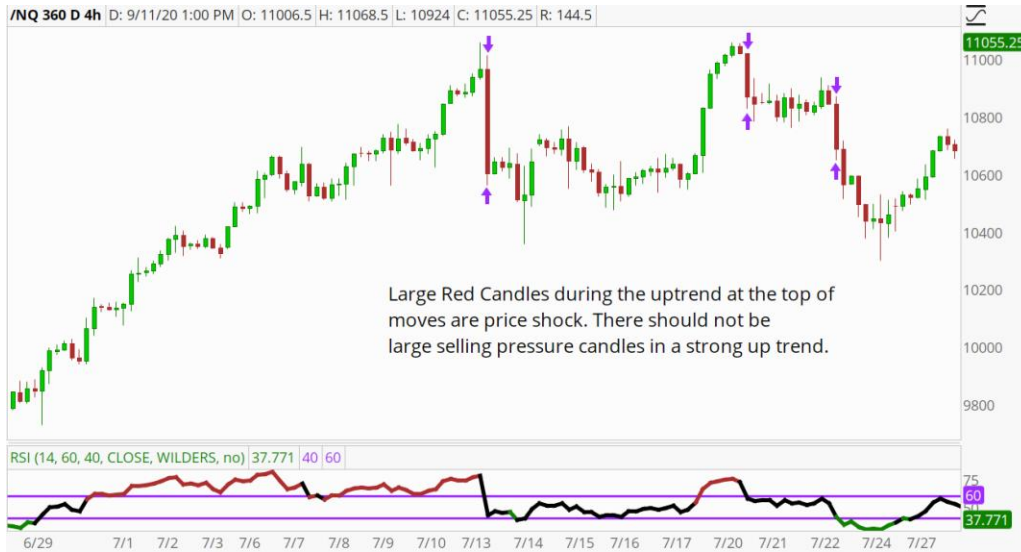

Confirming Reversals with RSI. The RSI will often show divergence on both the Trend Time Frame AND the Perspective Time Frame at the same time for reversals.

When analyzing related markets, often the leader will be the one that hits a reversal point. The others will follow. (i.e.: ES, NQ, YM, RTY or 6E, 6B, 6S or 6A, 6N, or GC, SI, PL, PA)

Price Shock – A large candle in the opposite direction of the trend. Must be near the beginning of the move in the opposite direction. If the large candle is happening after several candles in the opposite direction, it is a novice candle. One is not enough. If you experience two or more, trend is weak and look for a reversal soon.

On 240 min trends and above, keep the seasonality in mind. MRCI.com is \$379 / yr but if you state Wealth – Brandon in the Source (how did you hear) 10% discount = \$341/yr
